

Masts for Pallet Stackers

Pallet stackers come in various designs and capabilities. For a company in the market to acquire one, the plethora of choices also means that some careful thought has to be applied for selecting the one equipment which fits all the requirements, both present and future. Some parameters that need to be borne in mind are the height to which the forks need to be raised, the maximum weight that the lift must be capable of lifting and transporting, and the width that the forks must have to hold the items properly, without the items not toppling over. There are pallet stacker brands in the market where the distance between the forks can be adjusted with the help of another button on the handle. This enables the operator to easily manipulate items of various widths and sizes. This makes the pallet stacker quite versatile.
